- Motivation
- Objectives
- Integrated QoS-management
- QoS-management Building Blocks
 - Classification of Traffic and Marking
 - Topology Recognition
 - Network Planning
 - QoS-profile Provisioning
 - Call/Session Admission Control
 - QoS-/SLA-monitoring
- Outlook

Motivation

Outline

Motivation

Objectives

Integrated QoS-
management

QoS-management

Building Blocks

Outlook

- Enterprise Networks migrate to multi-service networks
- Network must accommodate Different Traffic Types
 - Real-time Voice over IP (VoIP), interactive video-conferences
 - Mission-critical Enterprise Resource Planning (ERP)
 - Guaranteed throughput, best effort
- Over provisioning of network resources economically not feasible (e.g. over WAN-links)

Objectives

Outline

Motivation

Objectives

Integrated QoS-
management

QoS-management

Building Blocks

Outlook

- QoS-management Framework
 - Addresses Professional Service and Managed Service needs (cost-effective service offering)
 - Supports self-maintainers (ease-of-use, intuitive)
 - Automated as far as possible
 - Transparent
 - Future-proof
 - Integrated with umbrella management functions
 - Fault Management / Network Map
 - Performance Management
 - Configuration Management

QoS-management Building Blocks Traffic Classification and Marking

Outline

Motivation

Objectives

Integrated QoS-
management

QoS-management

Building Blocks

Outlook

Establishment of QoS-policy profile

- Corresponding Traffic Marking
 - IEEE802.1D, Differentiated Services
 - Preferably by endpoints (hosts)
 - In application-aware access switches on behalf of the endpoints
- Central, consistent QoS-profile provisioning in endpoints (IP-phones, soft-phones, access points and gateways)
- Application-layer classification

QoS-management Building Blocks Topology Recognition

Outline

Motivation

Objectives

Integrated QoS-
management

QoS-management

Building Blocks

Outlook

Detect layer 2 and layer 3 topology

- Routers, switches, hubs, and hosts
- Connectivity and routing tables
- Explore properties of the links
 - Link capacities
 - Applied QoS-policies
- Create and maintain topology database
- Detection of topology changes via SNMP or OSPF
- Cope with the following problems:
 - Erroneous MIB-contents, VLAN detection

Detailed presentation by Marie Tromparent, TU Munich - LKN

QoS-management Building Blocks Network Planning

Outline

Motivation

Objectives

Integrated QoS-
management

QoS-management

Building Blocks

Outlook

Traffic Modeling

- Derive Service Rate (r) under given QoS-constraints according to established SLA
 - Includes max. delay boundary, packet loss
- Link Dimensioning
 - Acceptable bandwidth demand calculation for almost guaranteed QoS at given target outage probability
- Network Dimensioning
 - Import physical layer from Topology Recognition
 - Apply traffic matrix per service

QoS-management Building Blocks Network Planning

QoS-management Building Blocks QoS-profile Provisioning

Outline

Motivation

Objectives

Integrated QoS-
management

QoS-management

Building Blocks

Outlook

QoS-profile Provisioning

- Central QoS-parameter deployment services for
 - Complementary QoS-appliances
 - Workpoints and gateways
- Interface to IP-network vendor-specific Policy Management

QoS-management Building Blocks Call/Session Admission Control

Outline

Motivation

Objectives

Integrated QoS-
management

QoS-management

Building Blocks

Outlook

- Complete call only if IP-network resources are available for the call with toll quality
 - Endpoints have to identify negotiated codec type, speech samples per packet
 - Central signaling entities (H.323 Gatekeeper, SIP-proxy) intercept call and query resource manager (bandwidth broker) for admission
- Option: Abstracted Network Topology focusing on over-provisioned zones and bottleneck link
- Option: Link-by-link reservation along the connection path
- Option: Static vs. adaptive (dynamic) approach
- Reapply reservations after network changes

QoS-management Building Blocks

QoS-/SLA-monitoring

Outline

Motivation

Objectives

Integrated QoS-
management

QoS-management

Building Blocks

Outlook

- QoS-monitoring agents in work-points and access-points
 - Monitor received RTP/RTCP-stream
 - Check against provisioned thresholds
 - Send QoS-reports after time interval or at the end of the call/session for post processing
 - Issue SNMP-traps in case of threshold violations
- SLA-monitoring for WAN via QoS-appliances

QoS-management Building Blocks QoS-/SLA-monitoring

Motivation

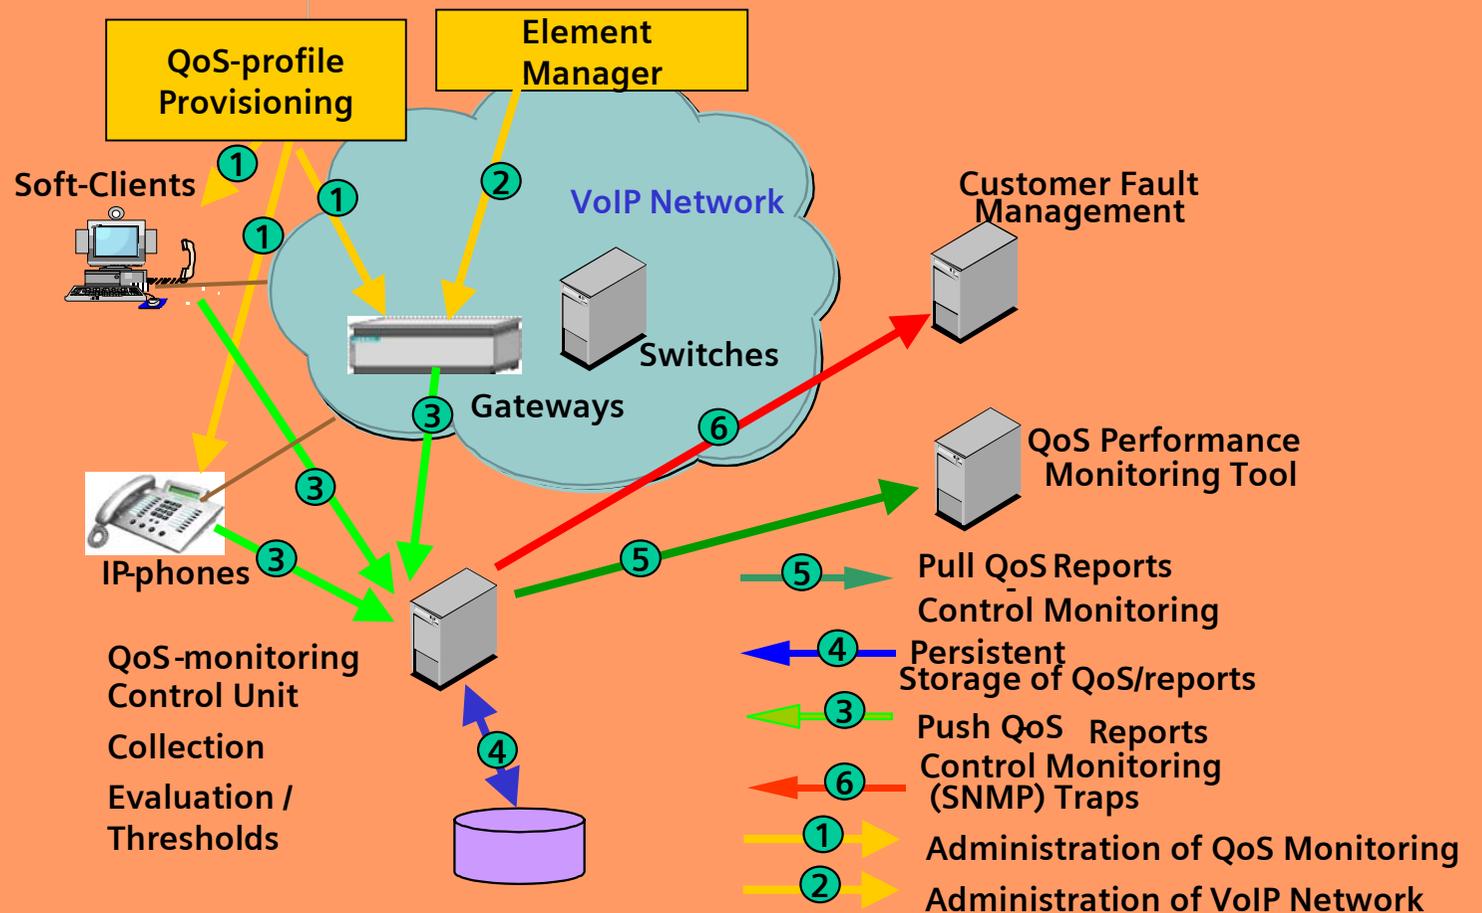

Objectives

Integrated QoS-
management

QoS-management

Building Blocks

Outlook

Outlook

Outline

Motivation

Objectives

Integrated QoS-
management

QoS-management

Building Blocks

Outlook

- Need for QoS-management is emerging
- Network vendors should move from proprietary CLI to emerging standard interfaces
- QoS-related interfaces should be protocol independent to be applicable for both H.323 and SIP
- Existing MIBs should be setup consistent and meaningful
- Customers should demand for and honor QoS-management functions
