Title:
PlanetLab and OneLab

Abstract:
PlanetLab is the successful international platform for testing
applications and conducting measurements at the scale of the
global internet. The EC-funded OneLab project, to start in
September 2006, will build on PlanetLab, extending its
capabilities into new environments, particularly wireless
environments, and deepening its monitoring capabilities, to yield
a better view of its topology and of packets as they traverse the
network. This talk will describe OneLab, and situate it in the
context of related efforts, such as the NSF's GENI project.
